This workbook includes an assessment of continuity of no-till management on cropland over time. The data cover 2017 and 2018, and "continuous" is defined as a pixel being defined as "no-till" in both years. The area of these pixels were then summed by county.

Using data from the 2017 US Census of Agriculture, the Climate Action Reserve assessment of eligibility uses the acres of no-till management in the numerator and the total cropland acres in the denominator in order to calculate the penetration rate as a percentage.

The Indigo assessment uses no-till acreage data calculated by our Atlas team. This assessment did not produce results for every county which was included in the Reserve's assessment, hence there are some blank rows in the All Counties table. The details of the methodology used to calculate the no-till acres for each county are contained in a document which will be provided separately. The source for total cropland acres, and the identification of crop type, is the Cropland Data Layer. Because the CDL acreage will naturally be different from the Ag Census acreage, the denominator will be different in the Indigo calculation of penetration rate.

The end result is a list of 60 counties where the Reserve's assessment found >50% penetration rate for no-till management while the Indigo assessment found that the penetration rate was 50% or lower.

Worksheets:

Target Counties
This sheet presents the list of 60 counties where the Indigo assessment argued for a change in eligibility

All Counties
This sheet compares the Reserve and Indigo results for every county in the US.

Indigo Dataset
This sheet contains the raw output from the Indigo Atlas regenerative practice study.

SEP Additionality Tool
This sheet contains a direct copy of the data provided by the Climate Action Reserve
