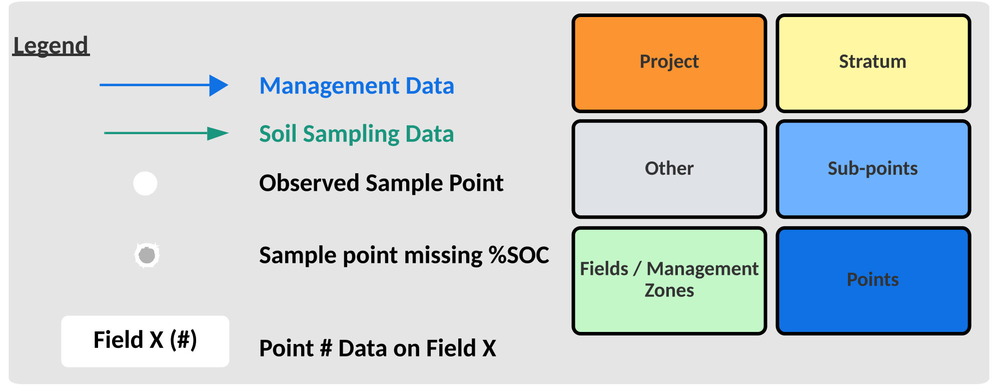
Field Level Data & Calculations
Point Level Calculations
Strata Level Calculations
Project Level Calculations
Default Equations
Aggregate by Level
Field A
Field B
Field C
Field D
Field E
Field F
Model Inputs (Points)
Field B (1)
Field B (2)
Field B (3)
Field B (4)
Field C (1)
Field C (2)
Field D (1)
Field D (2)
Field D (3)
Field E (1)
Field E (2)
Field E (4)
Field E (5)
External Soil and Weather Data (e.g. SSURGO and NLDAS)
Simulate SOC and Direct N_2O
Data Transformations*
model uncertainty
Model Outputs (Points)
Stratum Level Estimates for SOC and for direct N_2O (within validation domain)
Stratum ABC*** Average and Variance
Stratum D*** Average and Variance
Stratum EF*** Average and Variance
Filter to outside the direct N_2O validation domain and aggregate to stratum.
Total Area
Aggregate to Strata
Project Average SOC and direct N_2O and Variance
Sum averages across the reversible and non-reversible emission sources
Uncertaincty Deduction (Eq. 5.1)
Leakage Deduction (Eq. 5.30)
Actual Production History (APH) for Region and Project
Field Attributions and Pro-Rating
GHG Abatement Tonnes
Apply uncertainty and leakage deductions to non-reversible emissions reductions (eq. 5.6)
Total Project CRTs Issued
SOC-Related Tonnes
Apply uncertainty and leakage deductions to reversible emission reductions. (eq. 5.3 & 5.2)
Monitoring non-crediting fields for permanence**
Remote Sensing, external data sources, and historical management data.
Net Reversal
Avoidable Revesals
Unavoidable Revesals
Buffer Pool Contribution (eq. 5.4)
Compensate for reversals (eq. 5.5)
Reversals reflected as negative CRTs. (Proposal for Handling Permanence)



**Monitoring for permanence: See Chapter 6 of the Monitoring Plan for a description of Indigo's methods to monitor fields that have left the Project.
***Example of allocation of fields to strata, not a diagram specific to this RP.

*Data Transformations:

1) Generating random variance components and model uncertainty for each MC simulation
2) Averaging baseline simulations
3) Calculate difference (project - average baseline) at each point and MC simulation
4) Use default equation output at the point level when direct N_2O model QC fails.
